

Atty Docket No. MEMS-0160-US  
Appl. No.: 09/895,152

Amtd. Dated 26 October 2004  
Reply to Office Action of 7July 2004

**Amendments to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

1. (previously presented) A method for forming a mask, which comprises:
  - providing a photosensitive material;
  - performing at least one pass to write a pattern onto the photosensitive material, wherein each pass is offset such that no two passes write along the same path; and
  - developing the photosensitive material.
2. (original) The method of claim 1, further comprising etching the photosensitive material.
3. (original) The method of claim 1, wherein the photosensitive material is a photoresist, an e-beam resist, a HEBS glass, an emulsion or a black resist.
4. (original) The method of claim 1, wherein there are about 2-8 passes.
5. (canceled)
6. (original) The method of claim 1, wherein the at least one pass is performed using a laser, uv, electron beam, infrared, visible or x-ray source.

Reply to Office Action of 7July 2004

7. (original) The method of claim 1, wherein stitching error and exposure non-uniformity is reduced.

8. (original) A method of lithographic processing for the formation of a microstructure, which comprises:

providing a substrate; applying a photosensitive material over the substrate; performing at least one pass to write a pattern of a specific structure onto the photosensitive material, whereby stitching error and exposure non-uniformity is reduced;

melting at least a portion of the photosensitive material, whereby general roughness error is reduced;

developing the photosensitive material; and

removing remaining photosensitive material.

9. (original) The method of claim 8, further comprising: etching the photosensitive material to transfer the microstructure onto the substrate.

10. (original) The method of claim 8, wherein the at least one pass is performed using a mask.

11. (original) The method of claim 10, wherein the mask has been formed using a plurality of passes.

12. (original) The method of claim 8, wherein the step of melting comprises a step of heating the photosensitive material at a temperature for a period of time.
13. (original) The method of claim 12, wherein the temperature is about 80-170°C and the time is up to about 1 hour.
14. (original) The method of claim 12, wherein the temperature is about 60-90°C and the time is greater to or equal to about 30 minutes.
15. (original) The method of claim 8, wherein the step of melting comprises placing the photosensitive material upside down near a heat source.
16. (original) The method of claim 14, wherein the heat source comprises a hot plate.
17. (original) The method of claim 8, wherein the step of melting comprises flowing a hot fluid or solvent vapor across the surface of the photosensitive material.
18. (original) The method of claim 8, wherein the method further comprises: performing gray scale lithography.
19. (original) The method of claim 17, wherein the gray scale lithography process is half tone process.
20. (original) The method of claim 18, wherein the gray scale lithography process is a

modulated exposure masking process.

21. (original) The method of claim 8, wherein there are about 2-8 passes.

22. (original) The method of claim 8, wherein each pass is offset such that no two passes write along a same path.

23. (previously presented) A mask, the mask being formed by a process comprising:

providing a photosensitive material;

performing at least one pass to write a pattern onto the photosensitive material,

wherein each pass is offset such that no two passes write along the same path; and

developing the photosensitive material.

24. (original) The mask of claim 23, wherein the photosensitive material is a photoresist.

25. (original) The mask of claim 23, wherein there are about 2-8 passes.

26. (canceled)

27. (original) The mask of claim 23, wherein the process further comprises etching the photosensitive material.

28. (original) The mask of claim 23, wherein stitching error and exposure non-uniformity is reduced.

29-35 (canceled)

36. (previously presented) A method for improving surface quality of a pattern of a photosensitive material comprising:

providing the photosensitive material;

performing at least two passes to write the pattern onto the photosensitive material, wherein each pass is offset such that no two passes write along the same path for writing the pattern; and

melting a surface layer of a portion of the pattern to reduce general roughness error of the surface layer of the portion of the pattern.

37. (previously presented) The method of claim 36, wherein there are between 2-8 passes to write the pattern.

38. (previously presented) The method of claim 36, further comprising:

developing the photosensitive material.

39. (previously presented) The method of claim 36, wherein melting the top layer comprises at least one of:

placing the photosensitive material upside down near a heat source, and flowing a hot fluid or solvent vapor across the surface of the photosensitive material.

40. (previously presented) The method of claim 36, wherein the photosensitive material is at least one of a photoresist, an e-beam resist, a HEBS glass, an emulsion, and a black resist.

41. (previously presented) The method of claim 36, wherein writing the pattern is performed using at least one of a laser, uv, electron beam, infrared, visible and x-ray source.

42. (previously presented) The method of claim 36, wherein a depth of melting is determined as the root mean square of roughness of the surface layer.
